

Minimise the risk of collisions between forklifts and pedestrians

Pedestrian Cross Safety (PCS)

The Pedestrian Cross Safety (PCS) solution is a system of traffic lights that indicates the presence of pedestrians crossing to forklift drivers.

Pedestrians are fitted with a tag that is detected by an activator, which will trigger the traffic light to indicate the presence of pedestrians at the crossing.

The system comprises the following components:

- RFID activator AC-50 - triggers a traffic light at the crossing
- Traffic light
- Personal tag T-10 - worn by the pedestrian to trigger the traffic light on approach

System features:

- Easy implementation by local distributor or installer
- Durable and robust system's components
- Applicable to all types of industrial vehicles
- Detection of trucks and pedestrians in the proximity of the traffic light

Areas of Application:

- Confined areas
- Poor visibility areas at junctions between forklifts and pedestrians
- Areas with high forklift traffic
