

SHOCKWATCH®

Damage Prevention and Safety Solutions

Food 8°C

4 Hours – TP349

User Manual

How to use

Inactive

Active – threshold
not exceeded

Active – threshold
exceeded 4 hours

1. Activation: This is possible only when the temperature of the product is above refrigerated temperatures. Fully squeeze the button between thumb and finger. A blue line and ON will appear. Within 5 minutes, place the Food indicator below 6°C for a minimum of 1 hour. This will arm the indicator so it can begin to monitor temperature. If item or carrying card is already below 6°C , indicator can be stuck to it directly after activation. In the unlikely event that an indicator shows blue before you activate it, simply discard. 1-2 indicators per 100 count are always provided free of charge.

2. Monitoring: Once the Food indicator is armed, as long as temperatures stay below 8°C the blue dye will not progress to the white window. No breach has occurred.

3. Breached: Every time temperature breaches 8°C the blue dye will move across the white window and record the cumulative time spent in breach. The progress of the blue dye is irreversible but it will stop each time the temperature drops to 6°C or less.
